

Industrial livestock production accounts for 18% of all emissions of greenhouse gases in the world, which is about 40% more than all exhaust emissions which account for 13% of CO₂ release into the atmosphere. Factory farming also accounts for 37% of methane production and 65% of nitrogen suboxide production, the two gases being significantly responsible for the greenhouse effect. That is why, during the school open day, our team invited everyone to a workshop entitled “Entomological Delicacies” during which they could taste some specialities made with insects. For some students it was the first time they had tried something like that. We had also prepared a few insectaria for the guests to admire the beauty of these animals.

Total number of participants: 100

Place: Szramek High School
